1 Introduction

1.1 Annotation

Modern tendencies of telecommunication development necessitate operators to search for the most optimal technologies, allowing you to satisfy rapidly growing needs of subscribers, maintaining at the same time consistency of business processes, development flexibility and reduction of costs of various services provision. Wireless technologies are spinning up more and more and have paced a huge way for short time from unstable low-speed communication networks of low radius to broadband networks equitable to speed of wired networks with high criteria to the quality of provided services.

WEP-2L is dedicated to be installed inside buildings as an access point and to create a seamless wireless network using several identical access points ("Roaming") on a large area.

This manual specifies intended purpose, main technical parameters, design, safe operation rules and installation and configuration recommendations for WEP-2L.

1.2 Symbols

-  Notes contain important information, tips or recommendations on device operation and setup.

Notes and warnings

-  Warnings are used to inform the user about harmful situations for the device and the user alike, which could cause malfunction or data loss.

2 Device description

2.1 Purpose

WEP-2L wireless access point is designed for provision of users' access to high-speed safe network.

The device is dedicated to create L2 wireless networks interfacing with a wired network. WEP-2L is connected to a wired network via 10/100/1000M Ethernet interface and arrange high-speed access to the Internet for devices supporting Wi-Fi technology at 2.4 and 5 GHz.

The device has two radio interfaces to organize two physical wireless networks.

WEP-2L supports up-to-date requirements to service quality and allows transmitting more important traffic in higher priorities queues. Prioritization is based on main QoS technologies: CoS (special tags in VLAN packet field) and ToS (tags in IP packet field).

ACL rule creation functionality and support for traffic shaping on each VAP allows you to fully manage access, service quality and restrictions, both for all subscribers and for everyone in particular.

The devices are designed to be installed in offices, state buildings, conference halls, laboratories, hotels, etc. The creation of virtual access points with different types of encryption allows clients to delimit access rights among users and groups of users.

2.2 Device specification

Interfaces:

- 1 port of Ethernet 10/100/1000BASE-T(RJ-45) with PoE+ support;
- Wi-Fi 2.4 ГГц IEEE 802.11b/g/n;
- Wi-Fi 5 ГГц IEEE 802.11a/n/ac.

Functions:

WLAN capabilities:

- Support for IEEE 802.11a/b/g/n/ac standards;
- Support for IEEE 802.11r/k/v roaming standards;
- Data aggregation, including A-MPDU (Tx/Rx) and A-MSDU (Rx);
- WMM-based priorities and packet planning;
- WDS;
- Dynamic frequency selection (DFS);
- Support for hidden SSID;
- 8 virtual access points
- Third-party access point detection;
- Spectrum analyzer;
- Channel autoselection.

Network functions:

- Autonegotiation of speed, duplex mode and switching between MDI and MDI-X modes;
- IPv6;
- Support for VLAN;
- Authentication support 802.1X;
- DHCP client;
- ACL;
- NTP;
- Support for Syslog;
- GRE;
- GRE over IPsec;
- Transmission of subscriber traffic out of tunnel.

QoS functions

- Priority and profile-based packet scheduling;
- Bandwidth limitation for each VAP;
- Bandwidth limitation for each client;
- WMM parameters changing.

Security

- Centralized authorization via RADIUS server (WPA Enterprise);
- WPA/WPA2;
- Captive Portal.

The figure below shows WEP-2L application scheme.

Figure 1 – WEP-2L application scheme

2.3 The device technical parameters

Table 1 – Main Specifications

WAN Ethernet interface parameters	
Number of ports	1
Electrical connector	RJ-45
Data rate, Mbps	10/100/1000, auto-negotiation
Standards	BASE-T
Wireless interface parameters	
Standards	802.11a/b/g/n/ac
Frequency range, MHz	2400–2483,5 MHz, 5150–5850 MHz

Modulation	DSSS, CCK, BPSK, QPSK, 16QAM, 64QAM, 256QAM
Operating channels	802.11b/g/n: 1–13 (2402–2482 MHz) 802.11a/n/ac: • 36–64 (5170–5320 MHz) • 100–144 (5490–5720 MHz) • 149–165 (5745–5835 MHz)
Data rate, Mbps	802.11a: up to 54 Mbps 802.11b: up to 11 Mbps 802.11g: up to 54 Mbps 802.11n: up to 300 Mbps 802.11ac: up to 867 Mbps
Built-in antenna gain	2.4 GHz: ~5 dBi 5 GHz: ~5 dBi
Maximum output power of the transmitter	2.4 GHz: up to 20 dBm 5 GHz: up to 20 dBm
Receiver sensitivity	2.4 GHz: up to -94 dBm 5 GHz: up to -94 dBm
Security	Centralized authorization via RADIUS server (WPA Enterprise) WPA/WPA2 data encryption Captive Portal
Support for 2x2 MIMO	
Two Realtek Wi-Fi chips: RTL8197FS (2.4 GHz) and RTL8812FR (5 GHz).	
Control	
Remote control	Web interface, Telnet, SSH, CLI, SNMP, NETCONF, EMS management system
Access restriction	by password
General parameters	
Processor	Realtek RTL8197FS 1 GHz
Flash	32 MB NAND Flash
RAM	128 MB RAM DDR3
Power supply	PoE+ 48V/56V (IEEE 802.3at-2009).
Maximum power consumption	9 W
Range of operation temperatures	from +5 to +40°C
Relative humidity at 25°C	up to 80%
Dimensions (Diameter x Height)	200x40 mm
Weight	0.4 kg

2.4 Design

WEP-2L enclosed in plastic case.

2.4.1 Device main panel

The main panel layout of the device is depicted in Figure 2.

Figure 2 – WEP-2L main panel layout

Connectors and controls located on the device main panel are listed in Table 2.

Table 2 – Description of ports and controls

Main panel element		Description
1	LAN	GE (PoE) port status light indication
2	GE (PoE)	GE port for PoE+ power supply connection
3	F	Button for resetting to factory settings
4	Wi-Fi	Operation indicators of corresponding Wi-Fi modules

2.5 Light indication

The current device state is displayed by **Wi-Fi**, **LAN**, **Power** indicators. The list of indicators' possible states is given below.

Table 3 – Light indication of device state

LED	LED status	Device state
Wi-Fi	solid green	the Wi-Fi network is active
	flashing green	the process of data transmission through a wireless network
LAN	solid green (10, 100 Mbps)/ solid orange (1000 Mbps)	the link with the connected network device is established
	flashing green	the process of packet data transmission through LAN interface
Power (on the device top panel)	solid green	the device power on, normal operation
	solid orange	the device is loaded but IP address is not received via DHCP
	solid red	the device is loading

2.6 Reset to the default settings

In order to reset the device to factory settings, press and hold the “F” button until “Power” indicator starts flashing. Device will be rebooted automatically. DHCP client will be launched by default. If the address is not obtained via DHCP, the device will have the default IP address — *192.168.1.10*, and the following netmask — *255.255.255.0*.

2.7 Delivery package

The delivery package includes:

- WEP-2L wireless access point;
- Mounting kit;
- Operations manual on a CD (optional);
- Conformity certificate;
- Technical passport.

3 Rules and recommendations for device installation

This section defines safety rules, installation recommendations, setup procedure and the device starting procedure.

3.1 Safety rules

1. Do not install the device close to heat sources or in rooms with temperature below 5 °C or above 40 °C.
2. Do not use the device in places with high humidity. Do not expose the device to smoke, dust, water, mechanical vibrations or shocks.
3. Do not open the device case. There are no user serviceable parts inside.

 Do not cover ventilation holes and do not put other objects on the device in order to prevent overheating of device components.

3.2 Installation recommendations

1. The recommended installation: Horizontal, on a ceiling.
2. Before you install and enable device, check the device for visible mechanical defects. If defects are observed, you should stop the device installation, draw up corresponding act and contact the supplier.
3. If the device has been exposed for a long time at a low temperature, it must be left to stand for two hours at room temperature before use. After a long stay of the device in conditions of high humidity, let it stand under normal conditions for at least 12 hours before switching on.
4. During the device installation to provide Wi-Fi coverage area with the best characteristics take into account the following rules:
 - a. Install the device at the center of a wireless network;
 - b. Minimize the number of obstacles (walls, roof, furniture and etc.) between access point and other wireless network devices;
 - c. Do not install the device near (about 2 m) electrical and radio devices;
 - d. It is not recommended to use radiophone and other equipment operating on the frequency of 2.4 GHz, 5 GHz in Wi-Fi effective radius;
 - e. Obstacles in the form of glass/metal constructions, brick/concrete walls, water cans and mirrors can significantly reduce Wi-Fi action radius. It is not recommended to place the device inside a false ceiling as metal frame causes multipath signal propagation and signal attenuation.
5. During the installation of several access points, cell action radius must overlap with action radius of a neighboring cell at level of -65 ÷ -70 dBm. Decreasing of the signal level on cells borders to -75 dBm is permitted if it involves the use of VoIP, streaming video and other traffic that is sensitive to losses in wireless network.

3.3 Calculating the number of required access points

To calculate the required number of access points, you should evaluate the required coverage zone. For a more accurate assessment, it is necessary to make a radio examination of the room. Approximate radius of coverage area of WEP-2L with a good-quality signal in case of mounting on a ceiling in typical office: 2.4 GHz 40-50 m, 5 GHz: 20-30 m. In the absence of obstacles, the coverage radius: 2.4 GHz up to 100 m; 5 GHz up to 60 m.

The table below describes rough attenuation values.

Table 4 – Attenuation values

Material	Change of signal level, dB	
	2.4 GHz	5 GHz
Organic glass	-0,3	-0,9
Brick	-4,5	-14,6
Glass	-0,5	-1,7
Plaster slab	-0,5	-0,8
Wood laminated plastic	-1,6	-1,9
Plywood	-1,9	-1,8
Plaster with wirecloth	-14,8	-13,2
Breezeblock	-7	-11
Metal lattice (mesh 13*6 mm, metal 2 mm)	-21	-13

3.4 Channel selection for neighboring access points

It is recommended to set nonoverlapping channels to avoid interchannel interference among neighboring access points.

Figure 3 – General diagram of frequency channel closure in the range of 2.4 GHz

For the example of channel allocation scheme among neighboring access points in frequency range of 2.4 GHz when channel width is 20 MHz, see Figure 4.

Figure 4 – Scheme of channel allocation among neighboring access points in the frequency range of 2.4 GHz when channel width is 20 MHz

Similarly, the procedure of channel allocation is recommended to save for access point allocation between floors, see Figure 5.

Figure 5 — Scheme of channel allocation between neighboring access points that are located between floors

When width of used channel is 40 MHz there is no non-overlapping channels in frequency range of 2.4 GHz. In such cases, you should select channels maximally separated from each other.

Figure 6 — Channels used in range of 5 GHz when channel width is 20, 40 or 80 MHz

4 Installing WEP-2L

The device should be attached to plain surface (wall or ceiling) in accordance with the safety instruction and recommendations listed above.

The device delivery package includes required mounting kit to attach the device to plain surface.

4.1 Wall mounting

1. Fix the bracket (included in the delivery package) to the wall:

Figure 7 – Attaching the bracket to a wall

- a. The figure shows the bracket allocation.
- b. When installing the bracket, pass wires through the corresponding channels of the bracket, see figure 7.
- c. Pass the wires into the corresponding grooves on the bracket while installing the bracket. Screw the brackets to the device surface by using screwdriver.

2. Install the device

Figure 8 – Device installation (front view)

- a. Connect cables to corresponding connector of the device. Description of the connectors is given in section 2.4 Design.
- b. Align the device and bracket together, fix the position, turning clockwise.

4.2 Installing to false ceiling

⚠ It is not recommended to place the device inside a false ceiling as metal frame causes multipath signal propagation and signal attenuation.

1 – metal bracket; 2 – armstrong panel; 3 – plastic bracket; 4 – device.

Figure 9 – Mounting to a false ceiling

1. Fasten metal and plastic bracket on a ceiling as shown in the figure 9.
 - a. The plastic bracket (3) should be joined with the metal one (1) on the ceiling in the following order: metal bracket -> armstrong panel -> plastic bracket.
 - b. Cut the hole in the armstrong panel. The size of the hole should be equal to hole of metal bracket. Conduct wires through the hole.
 - c. Align holes in metal bracket with holes of armstrong panel and plastic bracket. Align together three boltholes on the plastic bracket and the boltholes on the metal bracket. Screw the brackets to the device surface by using a screwdriver.
2. Install the device.
 - a. Connect cables to corresponding connector of the device. Description of the connectors is given in section 2.4 Design.
 - b. Align the device and plastic bracket together, fix the position, turning clockwise.

4.3 Removing the device from the bracket

For removing the device from the bracket:

1. Turn the device counter-clockwise, figure 7.
2. Remove the device.

5 Device management via the web interface

5.1 Getting started

In order to start the operation, you should connect to the device via WAN interface using a web browser:

1. Open a web browser, for example, Firefox, Opera, Chrome.
2. Enter the device IP address in the browser address bar.

✓ **IP address by default: 192.168.1.10, subnet mask: 255.255.255.0. The device is capable to obtain an IP address via DHCP.**

When the device is successfully detected, username and password request page will be shown in the browser window

3. Enter your username into "Login" and password into "Password" field.

✓ **Factory settings: login: *admin*, password: *password*.**

4. Click the "Log in" button. A menu for monitoring the status of the device will open in a browser window.

Device Information	
Product	WEP-2L
Hardware Version	2v2
Factory MAC Address	E8:28:C1:F7:80:70
Serial Number	WP23002569
Software Version	1.0.0 (Build 1100)
Backup Version	1.0.0 (Build 1100)
Boot Version	1.0.0 (Build 1)
System Time	13.12.2021 08:01:25
Uptime	3 d, 22:06:05

5. If necessary, you can switch the information display language. Russian and English languages are available for web interface.

5.2 Applying configuration and discarding changes

1. Applying configuration

Clicking on the  button starts the process of saving the configuration to the device flash memory and applying the new settings. All the settings come into operation without device rebooting.

Visual indication of the process current status of the setting application process is realised in the web interface, table 7.

Table 7 – Visual indication of the current status of the setting application process

Image	State description
	After pressing "Apply", the process of settings saving to device memory is launched. This is indicated by the  icon in the tab name and on the Apply button.
	Successful settings saving and application are indicated by  icon in the tab name.

2. Discarding changes

You can discard changes only before pressing "Apply" button. If you press "Apply" button, all the changed parameters will be applied and saved to device memory. You will not be able to return to previous configuration after pressing "Apply".

The button for discarding changes appears as follows: .

5.3 Web interface basic elements

Navigation elements of the web interface are shown on the figure below

User interface window is divided into five general areas:

1. Menu tabs categorize the submenu tabs: **Monitoring, Radio, VAP, Network settings, External Services, System.**
2. Interface language selection and Logout button designed to to end a session in the web interface under a given user.
3. Submenu tabs allow you to control settings field.
4. Devcie configuration field displays data and configuration.
5. Information field displays current firmware version.

5.4 The “Monitoring” menu

In the “**Monitoring**” menu you can view the current system state.

5.4.1 The “Wi-Fi clients” submenu

The “**Wi-Fi clients**” submenu displays information about the status of connected Wi-Fi clients.

Information on connected clients is not displayed in real time. In order to update the information on the page you should click the “Update” button.

- *No* – number of the connected device in the list;
- *Hostname* – network name of the device;
- *IP address* – IP address of the connected device;
- *MAC address* – MAC address of the connected device;
- *Interface* – interface of WEP-2L communication with the connected device;
- *Link Capacity* – parameter that reflects the effectiveness of the use of a modulation access point on the transmission. It is calculated based on the number of packets transmitted on each modulation to the client, and the reduction factors. The maximum value is 100% (means that all packets are transmitted to the client at maximum modulation for the maximum nss type supported by the client). The minimum value is 2% (in the case when the packets are transmitted to the modulation nss1mcs0 for a client with MIMO 3x3 support). The parameter value is calculated for the last 10 s.
- *Link Quality* – parameter that displays the status of the link to the client, calculated based on the number of retransmit packets sent to the client. The maximum value is 100% (all transmitted packets were sent on the first attempt), the minimum value is 0% (no packets were successfully sent to the client). The parameter value is calculated for the last 10 s.
- *Link Quality Common* – parameter that displays the status of the link to the client, calculated based on the number of retransmit packets sent to the client. The maximum value is 100% (all transmitted packets were sent on the first attempt), the minimum value is 0% (no packets were successfully sent to the client). The parameter value is calculated for the entire client connection time.
- *RSSI* – received signal level, dBm;
- *SNR* – signal/noise ratio, dB;
- *TxRate* – channel transmission rate, Mbps;
- *RxRate* – receive channel rate, Mbps;
- *Tx BW* – transmission bandwidth, MHz;
- *Rx BW* – reception bandwidth, MHz;

- *Uptime* – Wi-Fi client connection uptime.

To display more detailed information on a particular client, select it from the list. A detailed description includes the following options:

- *Total TX/RX, bytes* – the number of bytes sent/received on the connected device;
- *Total TX/RX, packets* – the number of packets sent/received on the connected device;
- *Data TX/RX, bytes* – the number of data bytes sent/received on the connected device;
- *Data TX/RX, packets* – the number of data packets sent/received on the connected device;
- *Fails, packets* – the number of packets sent with errors on the connected device;
- *TX Period Retry, packets* – the number of retries of transmission to the connected device in the last 10 seconds;
- *TX Retry Count, packets* – the number of retries of transmission to the connected device during the entire connection;
- *Actual TX/RX Rate, Kbps* – the current traffic transmission rate at the moment.

5.4.2 The "WDS" submenu

The WDS submenu displays information about the status of WEP-2L access points connected via WDS.

- *TX BW* – transmission bandwidth, MHz;
- *RX BW* – reception bandwidth, MHz;
- *Uptime* – Wi-Fi client connection uptime.

To display more detailed information on a particular client, select it from the list. A detailed description includes the following options:

- *Total TX/RX, bytes* – the number of bytes sent/received on the connected device;
- *Total TX/RX, packets* – the number of packets sent/received on the connected device;
- *Data TX/RX, bytes* – the number of data bytes sent/received on the connected device;
- *Data TX/RX, packets* – the number of data packets sent/received on the connected device;
- *Fails, packets* – the number of packets sent with errors on the connected device;
- *TX Period Retry, packets* – the number of retries of transmission to the connected device in the last 10 seconds;
- *TX Retry Count, packets* – the number of retries of transmission to the connected device during the entire connection;
- *Actual TX/RX Rate, Kbps* – the current traffic transmission rate at the moment.

5.4.3 The “Traffic Statistics” submenu

The “**Traffic Statistics**” section displays the diagrams of the speed of the transmitted/received traffic for last 3 minutes, as well as statistics on the amount of transmitted/received traffic since the access point was turned on.

The LAN Tx/Rx diagram shows the speed of the transmitted/received traffic via the access point's Ethernet interface in the last 3 minutes. The diagram is automatically updated every 6 seconds.

The WLAN0 and WLAN1 Tx/Rx diagrams show the last 3 minutes rate of transmitted/received traffic via Radio 2,4 GHz and Radio 5 GHz access point interfaces. The diagram is automatically updated every 6 seconds.

Transmit ▾

2.4 GHz	stand4_vap	Open	E8:28:C1:DA:E7:21	1/20	-41

After clicking on the “Scan” button, the process will be launched. After the scan is completed, a list of detected access points and information about them will appear:

- *Range* – specifies the range of 2.4 GHz or 5 GHz to which the access point was detected;
- *SSID* – SSID of the detected access point;
- *Security Mode* – security mode of the detected access point;
- *MAC* – MAC address of the detected access point;
- *Channel/Bandwidth* – radio channel on which the detected access point operates;
- *RSSI* – the level with which the device receives the signal of the detected access point, dBm.

✓ Please note that during the environment scan, the device’s radio interface will be disabled, which will make it impossible to transfer data to Wi-Fi clients during the scan.

5.4.5 The “Events” submenu

In this section, you can view a list of real-time informational messages which contains the following information:

#	Interface	Destination	Gateway	Netmask	Flags
0	br0	0.0.0.0	10.24.80.1	0.0.0.0	UG
1	br0	10.24.80.0	0.0.0.0	255.255.255.0	U

WAN Status:

- *Interface* — name of the bridge interface;
- *Protocol* — a protocol which is used for access to WAN;
- *IP address* — device IP address in external network;
- *RX Bytes* — number of bytes received on WAN;
- *TX Bytes* — number of bytes sent from WAN.

Ethernet:

- *Link Status* — Ethernet port status;
- *Speed* — Ethernet port connection speed;
- *Duplex* — data transfer mode:
 - *Full* — full duplex;
 - *Half* — half-duplex.

ARP

The ARP table contains information about the alignment between the IP and MAC addresses of neighboring network devices:

- *IP address* — device IP address;
- *MAC* — device MAC address.

Routes:

- *Interface* — name of the bridge interface;
- *Destination* — IP address of destination host or subnet that the route is established to;
- *Gateway* — gateway IP address that allows for the access to the Destination;
- *Netmask* — subnet mask;
- *Flags* — certain route characteristics. The following flag values exist:
 - **U** — means that the route is created and passable;

- **H** – identifies the route to the specific host;
- **G** – means that the route lies through the external gateway. System network interface provides routes in the network with direct connection. All other routes lie through the external gateways. G flag is used for all routes except for the routes in the direct connection networks;
- **R** – indicates that the route was most likely created by a dynamic routing protocol running on the local system using the reinstate parameter;
- **D** – indicates that the route was added as a result of receiving an ICMP Redirect Message. When the system learns the route from the ICMP Redirect message, the route will be added into the routing table in order to exclude redirection of the following packets intended for the same destination;
- **M** – means that the route was modified – likely by a dynamic routing protocol running on a local system with the “mod” parameter applied;
- **A** – points to a buffered route to which an entry in the ARP table corresponds;
- **C** – means that the route source is the core routing buffer;
- **L** – indicates that the destination of the route is one of the addresses of this computer. Such “local routes” exist in the routing buffer only;
- **B** – means that the route destination is a broadcasting address. Such “broadcast routes” exist in the routing buffer only;
- **I** – indicates that the route is connected to a ring (loopback) interface for a purpose other than to access the ring network. Such “internal routes” exist in the routing buffer only;
- **!** – means that datagrams sent to this address will be rejected by the system.

5.4.7 The “Radio Information” submenu

In the **“Radio Information”** submenu the current status of WEP-2L radio interfaces is displayed.

Radio 2.4 GHz	
Status	On
MAC	E8:28:C1:DA:CF:80
Mode	IEEE 802.11b/g/n
Channel	1 (2412 MHz)
Channel Bandwidth, MHz	20

Radio 5 GHz	
Status	On
MAC	E8:28:C1:DA:CF:85
Mode	IEEE 802.11a/n/ac
Channel	48 (5240 MHz)
Channel Bandwidth, MHz	20

The access point radio interfaces can be in two states: “On” and “Off”. The status of each radio interface is shown in the “Status” field.

The Radio status depends on whether the radio interface has virtual access points (VAPs) or WDS enabled. In case there is at least one active VAP on the radio interface, Radio will be in “On” status, otherwise – “Off”.

Depending on the Radio status, the following information is available for monitoring:

“Off”:

- *Status* – radio interface state;
- *MAC* – radio interface MAC address;
- *Mode* – radio interface operation mode according to IEEE 802.11 standards.

“On”:

- *Status* – radio interface state;
- *MAC* – radio interface MAC address;
- *Mode* – radio interface operation mode according to IEEE 802.11 standards;
- *Channel* – number of the wireless channel on which the radio interface is running;
- *Channel bandwidth* – bandwidth of the channel on which the radio interface is running.

5.4.8 The “Device Information” submenu

The “**Device Information**” submenu displays main WEP-2L parameters.

The screenshot shows the ELTEX WEP-2L web interface. The top navigation bar includes links for Monitoring, Radio, VAP, WDS, Network Settings, External Services, and System. The left sidebar lists various monitoring options: Wi-Fi Clients, WDS, Traffic Statistics, Scan Environment, Events, Network Information, Radio Information, and Device Information (which is currently selected). The main content area displays the following parameters:

Product	WEP-2L
Hardware Version	2v2
Factory MAC Address	E8:28:C1:F7:80:70
Serial Number	WP23002569
Software Version	1.2.0.19a488-1908
Backup Version	1.2.0.19a488-1908
Boot Version	1.1.0.19a488-19
System Time	13.12.2021 08:01:25
Uptime	3 d, 22:06:05

At the bottom of the main content area, there is a 'Refresh' button.

- *Product* — device model name;
- *Hardware Version* — device hardware version;
- *Factory MAC Address* — device WAN interface MAC address, setted by manufacturer;
- *Serial Number* — device serial number, setted by manufacturer;
- *Firmware Version* — device firmware version;
- *Backup Version* — previously installed firmware version;
- *Boot Version* — device firmware boot version;
- *System Time* — current time and date, setted in system;
- *Uptime* — the time since the last turn on or restart the device.

5.5 The “Radio” menu

In the “**Radio**” menu you can configure the wireless interface.

5.5.1 The “Radio 2.4 GHz” submenu

In the “**Radio 2.4 GHz**” submenu you can configure the main parameters of the radio interface of the device operating in the 2.4 GHz band.

The screenshot shows the WEP-2L web interface. The top navigation bar includes 'Monitoring', 'Radio', 'VAP', 'WDS', 'Network Settings', 'External Services', and 'System'. The 'Radio' tab is selected. On the left, there is a sidebar with 'Radio 2.4 GHz >', 'Radio 5 GHz', and 'Advanced'. The main content area is titled 'Common' and contains the following settings:

- Mode:** A dropdown menu showing 'IEEE 802.11b/g/n'.
- Auto Channel:** A checkbox that is checked.
- Use Limit Channels:** A checkbox that is checked.
- Channel List:** A list of channels with a delete icon (X) next to each: '1 (2412 MHz)', '6 (2437 MHz)', and '11 (2462 MHz)'.
- Channel Bandwidth, MHz:** A dropdown menu showing '20'.
- Transmit Power Limit, dBm:** A dropdown menu showing '16'.
- Fixed Transmit Rate:** A dropdown menu showing 'Auto'.
- Advanced:** A section that is currently collapsed, indicated by a downward arrow.
- Buttons:** 'Apply' and 'Cancel' buttons at the bottom.

- **Mode** – select interface operation mode:
 - IEEE 802.11b/g
 - IEEE 802.11b/g/n
 - IEEE 802.11n
- **Auto Channel** – when checked, the device will automatically select the least loaded radio channel for the Wi-Fi interface. Removing the flag opens the access to install the static operation channel;
- **Channel** – select channel for data transmission;
- **Use Limit Channels** – when checked, the access point will use a user-defined list of channels to work in automatic channel selection mode. If the “Use Limit Channels” flag is not checked or there are no channels in the list, the access point will select the operation channel from all available channels in the given band. 2.4 GHz range channels: 1-13;
- **Channel Bandwidth, MHz** – channel bandwidth, on which the access point operates. The parameter may take values of 20 and 40 MHz;
- **Primary Channel** – the parameter can only be changed if the bandwidth of a statically specified channel is equal to 40 MHz. The 40 MHz channel can be considered as consisting of two 20 MHz channels, which border in the frequency range. These two 20 MHz channels are called primary and secondary channels. The primary channel is used by clients who only support 20 MHz channel bandwidth:
 - **Upper** – the primary channel will be the upper 20 MHz channel in the 40 MHz band;
 - **Lower** – the primary channel will be the lower 20 MHz channel in the 40 MHz band;
- **Transmission Power Limit, dBm** – transmitting Wi-Fi signal power adjustment, dBm. May take values between 11 and 16 dBm;
- **Fixed Transmit Rate** – fixed wireless data transmission rate which is defined by IEEE 802.11b/g/n standards.

- ✓ If the “Use Limit Channels” list contains a channel that is not available for selection, it will be marked in grey. In order for the new configuration to be applied to an access point, only available (blue highlighted) channels must be specified in the “Use Limit Channels” list.

Example. No settings have been made on the access point yet, Radio 2.4 GHz is set to 20 MHz “Channel Bandwidth” by default, and channels are specified in the “Use Limit Channels” list: 1, 6, 11. Suppose the parameter “Channel Bandwidth” is set to 40 MHz. When you change this parameter from 20 MHz to 40 MHz, the following happens:

- the “Primary channel” parameter becomes available for editing and the default value is “Lower”;
- Channel 11 in the “Use Limit Channels” list changes its color from blue to gray.

If you change the “Channel Bandwidth” parameter to 40 MHz and do not remove the “grey” channels from the list, then when you click on the “Apply” button in the browser an error will appear – “There are errors in data. Changes was not applied”. Accordingly, the access point configuration will not be changed. This is due to the fact that channels in the “Use Limit Channels” list that are highlighted in grey do not fit the definition “Primary channel” = Lower.

In the “Advanced” section, you can configure advanced device’s radio interface parameters.

Advanced ▾

Short Guard Interval	☒
STBC	☐
Beacon Interval, ms	100
Fragmentation Threshold	2346
RTS Threshold	2347
Frame Aggregation	☒
Short Preamble	☒
Broadcast/Multicast Rate Limiting, p/s	0
Wi-Fi Multimedia (WMM)	☒
Enable QoS	☐

- *OBSS Coexistence* – automatic channel bandwidth reduction when the air is loaded. When the flag is set, the mode is enabled;
- *Short Guard interval* – support for Short Guard interval. Access point transmits data using 400 ns Guard interval (instead of 800 ns) to clients which also support Short GI;
- *STBC* – Space-Time Block Coding method dedicated to improve data transmission reliability. The field is available only if the selected mode of operation of the radio interface includes 802.11n. When checked, the device transmits one data flow through several antennas. When unchecked, the device does not transmit one data flow through several antennas;
- *Beacon Interval, ms* – beacon frames transmission period. The frames are sent to detect access points. The parameter takes values from 20 to 2000 ms, by default – 100 ms;
- *Fragmentation Threshold* – frame fragmentation threshold, bytes. The parameter takes values 256-2346, by default – 2346;
- *RTS Threshold* – after what quantity of bytes the Request to Send will be sent. Decreasing of the parameter's value might improve access point operation when there are a lot of clients connected.

However, decreasing of the parameter's value will reduce general bandwidth of wireless network. The parameter takes values from 0 to 2347, by default – 2347;

- *Aggregation* – enable support for AMPDU/AMSDU;
- *Short Preamble* – use of the packet short preamble;
- *Broadcast/Multicast Rate Limiting, p/s* – when the flag is set, transmission of broadcast / multicast traffic over the wireless network is restricted. Specify the limit for broadcast traffic in the popup window (p/s);
- *Wi-Fi Multimedia (WMM)* – WMM support activation (Wi-Fi Multimedia);
- *Enable QoS* – when the flag is set, the setting of Quality of Service functions is available.

The following functions are available for quality assurance configuration:

AP EDCA Parameters				
Queue	AIFS	cwMin	cwMax	TXOP Limit
Data 3 (Background)	7	15	1023	0
Data 2 (Best Effort)	3	15	63	0
Data 1 (Video)	1	7	15	94
Data 0 (Voice)	1	3	7	47
Station EDCA Parameters				
Queue	AIFS	cwMin	cwMax	TXOP Limit
Data 3 (Background)	7	15	1023	0
Data 2 (Best Effort)	3	15	1023	0
Data 1 (Video)	2	7	15	94
Data 0 (Voice)	2	3	7	47

- *AP EDCA parameters* – access point settings table (traffic is transmitted from the access point to the client):
 - *Queue* – predefined queues for various kinds of traffic:
 - *Data 3 (Background)* – low priority queue, high bandwidth (802.1p: cs1, cs2 priorities);
 - *Data 2 (Best Effort)* – middle priority queue, middle bandwidth and delay; Most of the traditional IP data is sent to this queue (802.1p: cs0, cs3 priorities);
 - *Data 1 (Video)* – high priority queue, minimal delay. In this queue, time-sensitive video data is automatically processed (802.1p: cs4, cs5 priorities);
 - *Data 0 (Voice)* – high priority queue, minimal delay. In this queue, time sensitive data is automatically processed, such as: VoIP, streaming video (802.1p: cs6, cs7 priorities).
 - *AIFS* – Arbitration Inter-Frame Spacing, defines the waiting time of data frames, measured in slots, takes values (1-255);
 - *cwMin* – the initial timeout value before resending a frame, specified in milliseconds, takes the values 1, 3, 7, 15, 31, 63, 127, 255, 511, 1023. The value of cwMin cannot exceed the value of cwMax;
 - *cwMax* – the maximum timeout value before resending a frame, specified in milliseconds, takes the values 1, 3, 7, 15, 31, 63, 127, 255, 511, 1023. The value of cwMax must exceed the value of cwMin;
 - *TXOP Limit* – this parameter is used only for data transmitted from the client station to the access point. The transmission capability is the time interval, in milliseconds, when the client WME station

has the rights to initiate data transmission over the wireless medium to the access point, the maximum value is 65535 milliseconds;

- *Station EDCA parameters* – table of client station parameter settings (traffic is transmitted from the client station to the access point). For description of table fields, see above.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.5.2 The “Radio 5 GHz” submenu

In the “**Radio 5 GHz**” submenu you can configure the main parameters of the radio interface of the device operating in the 5 GHz band.

The screenshot shows the WEP-2L web interface. The top navigation bar includes 'Monitoring', 'Radio', 'VAP', 'WDS', 'Network Settings', 'External Services', and 'System'. The 'Radio' tab is selected. On the left sidebar, 'Radio 2.4 GHz' is highlighted, and 'Radio 5 GHz >' is selected. The main content area is titled 'Common' and contains the following settings:

- Mode:** IEEE 802.11a/n/ac (dropdown menu)
- Auto Channel:** ☒
- Use Limit Channels:** ☒
- Channel List:** A list of channels with their frequencies and a delete icon (X):
 - 36 (5180 MHz) X
 - 40 (5200 MHz) X
 - 44 (5220 MHz) X
 - 48 (5240 MHz) X
- Channel Bandwidth, MHz:** 20 (dropdown menu)
- Transmit Power Limit, dBm:** 19 (dropdown menu)
- Fixed Transmit Rate:** Auto (dropdown menu)
- Advanced:** A section that is currently collapsed, indicated by a downward arrow.

At the bottom of the page, there are two buttons: 'Apply' (with a checkmark icon) and 'Cancel' (with an X icon).

- *Mode* – select interface operation mode:
 - IEEE 802.11a;
 - IEEE 802.11a/n;
 - IEEE 802.11a/n/ac.
- *Auto Channel* – when checked, the device will automatically select the least loaded radio channel for the Wi-Fi interface. Removing the flag opens the access to install the static operation channel;
- *Channel* – select channel for data transmission;
- *Use Limit Channels* – when checked, the access point will use a user-defined list of channels to work in automatic channel selection mode. If the “Use Limit Channels” flag is not checked or there are no channels in the list, the access point will select the operation channel from all available channels in the given band. 5 GHz range channels: 36-64, 132-144, 149-165;
- *Channel Bandwidth, MHz* – channel bandwidth, on which the access point operates. The parameter may take values of 20, 40 and 80 MHz;
- *Primary Channel* – the parameter can only be changed if the bandwidth of a statically specified channel is equal to 40 MHz. The 40 MHz channel can be considered as consisting of two 20 MHz channels, which border in the frequency range. These two 20 MHz channels are called primary and secondary channels. The primary channel is used by clients who only support 20 MHz channel bandwidth:
 - *Upper* – the primary channel will be the upper 20 MHz channel in the 40 MHz band;
 - *Lower* – the primary channel will be the lower 20 MHz channel in the 40 MHz band.
- *Transmission Power Limit, dBm* – transmitting Wi-Fi signal power adjustment, dBm. May take values between 11 and 19 dBm;

- **Fixed Transmit Rate** — fixed wireless data transmission rate which is defined by IEEE 802.11a/n/ac standards.

- ✓ If the “Use Limit Channels” list contains a channel that is not available for selection, it will be marked in grey. In order for the new configuration to be applied to an access point, only available (blue highlighted) channels must be specified in the “Use Limit Channels” list.

Example. No settings have been made on the access point yet, Radio 5 GHz is set to 20 MHz “Channel Bandwidth” by default, and channels are specified in the “Use Limit Channels” list: 36, 40, 44, 48.

Suppose the parameter “Channel Bandwidth” is set to 40 MHz. When you change this parameter from 20 MHz to 40 MHz, the following happens:

- the “Primary channel” parameter becomes available for editing and the default value is “Upper”;
- channels 36 and 44 in the “Use Limit Channels” list changes its color from blue to gray.

If you change the “Channel Bandwidth” parameter to 40 MHz and do not remove the “grey” channels from the list, then when you click on the “Apply” button in the browser an error will appear — “There are errors in data. Changes was not applied”. Accordingly, the access point configuration will not be changed. This is due to the fact that channels in the “Use Limit Channels” list that are highlighted in grey do not fit the definition “Primary channel” = Upper.

In the “Advanced” section, you can configure advanced device’s radio interface parameters.

Advanced ▾	
DFS Support	Enabled ▾
Short Guard Interval	☒
STBC	☐
Beacon Interval, ms	100
Fragmentation Threshold	2346
RTS Threshold	2347
Frame Aggregation	☒
Short Preamble	☒
Broadcast/Multicast Rate Limiting, p/s	0
Wi-Fi Multimedia (WMM)	☒
Enable QoS	☐

- **OBSS Coexistence** — automatic channel bandwidth reduction when the air is loaded. When the flag is set, the mode is enabled;
- **DFS Support** — dynamic frequency selection mechanism. The mechanism demands wireless devices to scan environment and avoid using channels which coincide with radiolocation system's channels at 5 GHz:
 - *Disabled* — the mechanism is disabled. DFS channels are not available for selection;
 - *Enabled* — the mechanism is enabled;
 - *Forced* — the mechanism is disabled. DFS channels are available for selection.
- **Short Guard interval** — support for Short Guard interval. Access point transmits data using 400 ns Guard interval (instead of 800 ns) to clients which also support Short GI;
- **STBC** — Space-Time Block Coding method dedicated to improve data transmission reliability. The field is available only if the selected mode of operation of the radio interface includes 802.11n. When checked,

the device transmits one data flow through several antennas. When unchecked, the device does not transmit one data flow through several antennas;

- *Beacon Interval, ms* – beacon frames transmission period. The frames are sent to detect access points. The parameter takes values from 20 to 2000 ms, by default – 100 ms;
- *Fragmentation Threshold* – frame fragmentation threshold, bytes. The parameter takes values 256-2346, by default – 2346;
- *RTS Threshold* – after what quantity of bytes the Request to Send will be sent. Decreasing of the parameter's value might improve access point operation when there are a lot of clients connected. However, decreasing of the parameter's value will reduce general bandwidth of wireless network. The parameter takes values from 0 to 2347, by default – 2347;
- *Aggregation* – enable support for AMPDU/AMSDU;
- *Short Preamble* – use of the packet short preamble;
- *Broadcast/Multicast Rate Limiting, p/s* – when the flag is set, transmission of broadcast / multicast traffic over the wireless network is restricted. Specify the limit for broadcast traffic in the popup window (p/s);
- *Wi-Fi Multimedia (WMM)* – WMM support activation (Wi-Fi Multimedia);
- *Enable QoS* – when the flag is set, the setting of Quality of Service functions is available.

The following functions are available for quality assurance configuration:

AP EDCA Parameters				
Queue	AIFS	cwMin	cwMax	TXOP Limit
Data 3 (Background)	7	15 ▼	1023 ▼	0
Data 2 (Best Effort)	3	15 ▼	63 ▼	0
Data 1 (Video)	1	7 ▼	15 ▼	94
Data 0 (Voice)	1	3 ▼	7 ▼	47
Station EDCA Parameters				
Queue	AIFS	cwMin	cwMax	TXOP Limit
Data 3 (Background)	7	15 ▼	1023 ▼	0
Data 2 (Best Effort)	3	15 ▼	1023 ▼	0
Data 1 (Video)	2	7 ▼	15 ▼	94
Data 0 (Voice)	2	3 ▼	7 ▼	47

- *AP EDCA parameters* – access point settings table (traffic is transmitted from the access point to the client):
 - *Queue* – predefined queues for various kinds of traffic:
 - *Data 3 (Background)* – low priority queue, high bandwidth (802.1p: cs1, cs2 priorities);
 - *Data 2 (Best Effort)* – middle priority queue, middle bandwidth and delay. Most of the traditional IP data is sent to this queue (802.1p: cs0, cs3 priorities);
 - *Data 1 (Video)* – high priority queue, minimal delay. In this queue, time-sensitive video data is automatically processed (802.1p: cs4, cs5 priorities);
 - *Data 0 (Voice)* – high priority queue, minimal delay. In this queue, time sensitive data is automatically processed, such as: VoIP, streaming video (802.1p: cs6, cs7 priorities).
 - *AIFS* – Arbitration Inter-Frame Spacing, defines the waiting time of data frames, measured in slots, takes values (1-255);

- *cwMin* – the initial timeout value before resending a frame, specified in milliseconds, takes the values 1, 3, 7, 15, 31, 63, 127, 255, 511, 1023. The value of *cwMin* cannot exceed the value of *cwMax*;
- *cwMax* – the maximum timeout value before resending a frame, specified in milliseconds, takes the values 1, 3, 7, 15, 31, 63, 127, 255, 511, 1023. The value of *cwMax* must exceed the value of *cwMin*;
- *TXOP Limit* – this parameter is used only for data transmitted from the client station to the access point. The transmission capability is the time interval, in milliseconds, when the client WME station has the rights to initiate data transmission over the wireless medium to the access point, the maximum value is 65535 milliseconds;
- *Station EDCA parameters* – table of client station parameter settings (traffic is transmitted from the client station to the access point). For description of table fields, see above.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.5.3 The “Advanced” submenu

In the “**Advanced**” section, you can configure advanced device’s radio interface parameters.

- *Global Isolation* – when checked, traffic isolation between clients of different VAP and different radio interfaces is enabled.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.6 The “VAP” menu

In the “**VAP**” menu, you can configure virtual Wi-Fi access points (VAP).

5.6.1 The “Summary” submenu

The “**Summary**” submenu displays the settings of all VAPs on Radio 2.4 GHz and Radio 5 GHz radio interfaces. You can see the settings of each virtual access point in sections VAP0..3.

Common settings

- *Enabled* – when checked, the virtual access point is enabled, otherwise it is disabled;
- *VLAN ID* – VLAN number from which the tag will be removed when transmitting Wi-Fi traffic to clients connected to this VAP. When traffic flows in the opposite direction, untagged traffic from clients will be tagged with VLAN ID (when VLAN Trunk mode is disabled);
- *SSID* – virtual wireless network name;
- *Broadcast SSID* – when checked, SSID broadcasting is on, otherwise it is disabled;
- *Band Steer mode* – when the flag is set, the client's priority connection to the 5 GHz network is active. For the function to work, create a VAP with the same SSID on each radio interface, and activate the “Band Steer” parameter on them;
- *VLAN Trunk* – when the flag is set, tagged traffic is transmitted to the subscriber;
- *General Mode* – when the flag is set, transmission of untagged traffic jointly with tagged traffic is allowed (available when Trunk VLAN mode is enabled);
- *General VLAN ID* – a tag will be removed from the specified VLAN ID and the traffic of this VLAN will pass to the client without a tag. When traffic passes in the opposite direction, untagged traffic will be tagged with General VLAN ID;
- *Station Isolation* – when checked, traffic isolation between clients in the same VAP is enabled;
- *Support for 802.11k/v* – enable support for 802.11k/v standards on virtual access point;
- *Priority* – select prioritization means. Defines the field on the basis of which the traffic transmitted to the radio interface will be distributed in WMM queues:

- *DSCP* – will analyze the priority from the DSCP field of the IP packet header;
- *802.1p* – will analyze the priority from the CoS (Class of Service) field of the tagged packets.
- *Maximum Stations* – the maximum number of clients connected to the virtual network;
- *Minimal Signal* – signal level in dBm below which the client equipment is disconnected from the virtual network;

- *Security Mode* – wireless access security mode:
 - *Off* – do not use encryption for data transfer. The access point is available for any subscriber to connect;
 - *WPA, WPA2, WPA/WPA2* – encryption methods, if you select one of the methods, the following setting will be available:
 - *WPA Key* – key/password required to connect to the virtual access point. The length of the key makes from 8 to 63 characters;
 - *WPA-Enterprise, WPA2-Enterprise, WPA/WPA2-Enterprise* – wireless channel encryption mode, in which the client is authorized on the centralized RADIUS server. To configure this security mode, you must specify the parameters of the RADIUS server. You also need to specify a key for the RADIUS server. If you select one of the methods, the following setting will be available:
 - *Domain* – user domain;
 - *IP Address of RADIUS Server* – RADIUS server address;
 - *Port of RADIUS Server*– port of the RADIUS server that used for authentication and authorization;
 - *Password of RADIUS Server* – password for the RADIUS server used for authentication and authorization;
 - *Use Accounting through RADIUS* – when checked, “Accounting” messages will be sent to the RADIUS server;
 - *Use Other Settings For Accounting*:
 - *IP Address of RADIUS Server for Accounting* – address of the RADIUS server, used for accounting;
 - *Password of RADIUS Server for Accounting*– password for the RADIUS server used for accounting.

- *Port of RADIUS Server for Accounting* – port that will be used to collect accounts on the RADIUS server:
 - *Use Periodic Accounting* – enable periodic sending of “Accounting” messages to the RADIUS server. You can set the interval for sending messages in the “Accounting Interval” field.

Captive Portal

Under security modes: Off, WPA, WPA2, WPA/WPA2 a portal authorization setting is available on the VAP.

- *Enable* – when checked, authorization of users in the network will be performed via the virtual portal;
- *Virtual Portal Name* – name of the virtual portal to which the user will be redirected when connecting to the network;
- *Redirect URL* – the address of the external virtual portal to which the user will be redirected when connecting to the network.

RADIUS

- *Use Accounting through RADIUS* – when checked, “Accounting” messages will be sent to the RADIUS server;
- *Domain* – user domain;
- *IP Address of RADIUS Server for Accounting* – address of the RADIUS server, used for accounting;
- *Port of RADIUS Server for Accounting* – port that will be used to collect accounts on the RADIUS server;
- *Password of RADIUS Server for Accounting* – password for the RADIUS server used for accounting;
- *Use Periodic Accounting* – enable periodic sending of “Accounting” messages to the RADIUS server. You can set the interval for sending messages in the “Accounting Interval” field.

Shapers

- *Show* – display configuration field;
- *VAP Limit Down* – restriction of bandwidth in the direction from the access point to the clients (in total) connected to this VAP, Kbps;
- *VAP Limit Up* – restriction of bandwidth in the direction from the clients (in total) connected to this VAP, to the access point, Kbps;

- *STA Limit Down* – restriction of bandwidth in the direction from the access point to the clients (each separately) connected to this VAP, Kbps;
- *STA Limit Up* – restriction of bandwidth in the direction from the clients (each separately) connected to this VAP, to the access point, Kbps.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.7 The “WDS” menu

In the WDS menu you can configure wireless bridges between WEP-2L.

- ✓ When configuring WDS connection, it is necessary that the same channel and channel width are selected in the radio interface settings on the devices that will connect via WDS.

5.7.1 The “WDS” submenu

WDS >

2.4 GHz 5 GHz

Enabled ☒

Security Mode WPA2

WPA Key

WDS Interfaces

Interface	MAC	Fixed Transmit Rate
wlan0-wds0 ☐	XX:XX:XX:XX:XX:XX	Auto
wlan0-wds1 ☐	XX:XX:XX:XX:XX:XX	Auto
wlan0-wds2 ☐	XX:XX:XX:XX:XX:XX	Auto
wlan0-wds3 ☐	XX:XX:XX:XX:XX:XX	Auto

✓ Apply ✕ Cancel

In the "2.4 GHz" and "5 GHz" tabs you can select the radio interface of the device on which you want to build a wireless bridge.

- *Enabled* – when flag is set, WDS mode is enabled, otherwise it is disabled;
- *Security Mode* – security access mode to the wireless network;
 - *Off* – do not use encryption for data transmission;
 - *WPA, WPA2* – encryption method, when selected, the following setting will be available:
 - *WPA key* – key/password necessary for connection to the oncoming access point. Key length is from 8 to 63 characters.
- *Interface* – select and enable the WDS interface on which the wireless bridge will be built;
- *MAC* – radio interface MAC address of oncoming device, to which the wireless bridge will be built. Radio interface MAC address can be viewed in web interface of oncoming device in tab "Monitoring"/"Radio Information". To configure WDS to Radio 2.4 GHz, you need to specify the MAC address of the Radio 2.4

GHz of the oncoming device. The configuration of the WDS interface on Radio 5 GHz is performed the same way – the MAC address of the Radio 5 GHz of the oncoming device is indicated;

- *Fixed Transmit Rate* – fixed wireless data transmission rate which is defined by IEEE 802.11b/g/n standards.

To apply a new configuration and save setting to non-volatile memory, click “Apply”. Click “Cancel” to discard the changes.

5.8 The “Network Settings” menu

5.8.1 The “System Configuration” submenu

The screenshot displays the 'Network Settings' menu for the WEP-2L device. The 'System Configuration' submenu is active, showing various network parameters. The 'Management VLAN' is set to 'Forwarding'. The 'Protocol' is set to 'Static', which enables the 'Static IP', 'Netmask', 'Gateway', 'Primary DNS Server', and 'Secondary DNS Server' fields. The 'Apply' button is highlighted in blue.

- *Hostname* – network name of the device, specified by string from 1 to 63 characters; latin uppercase and lowercase letters, numbers, hyphen “-” (hyphen can not be the last character in the name);
- *AP Location* – domain of the EMS management system tree host where the access point is located;
- *Management VLAN*:
 - *Disabled* – Management VLAN is not used;
 - *Terminating* – the mode in which the management VLAN is terminated at the access point; in this case, clients connected via the radio interface do not have access to this VLAN. When WDS is configured, this VLAN mode is unavailable for selection;
 - *Forwarding* – the mode in which the management VLAN is also transmitted to the radio interface (with the appropriate VAP configuration).
- *VLAN ID* – the VLAN ID used to access the device, takes values 1-4094;
- *Protocol* – select protocol for connection of the device via Ethernet interface to service provider network:
 - *DHCP* – operation mode, when IP address, subnet mask, DNS server address, default gateway and other parameters required for operation are obtained from DHCP server automatically;
 - *Static* – operation mode where IP address and all the necessary parameters for WAN interface are assigned statically. If “Static” is selected, the following parameters will be available to set:
 - *Static IP* – device WAN interface IP address in the provider network;
 - *Netmask* – external subnet mask;
 - *Gateway* – address, to which the packet is sent, if the route in routing table is not found for it.
 - *Primary DNS server, Secondary DNS server* – IP address of DNS servers. If DNS servers' addresses are not allocated automatically via DHCP, set them manually.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.8.2 The “Access” submenu

In the “**Access**” submenu, you can configure access to the device via the Web interface, Telnet, SSH, NETCONF and SNMP.

The screenshot shows the WEP-2L web interface with the 'Network Settings' tab selected. The 'Access' submenu is active, displaying configuration options for various protocols. The 'WEB' checkbox is checked, with the HTTP Port set to 80. The 'WEB-HTTPS' checkbox is also checked, with the HTTPS Port set to 443. Other protocols like Telnet, SSH, NETCONF, and SNMP are also checked. Below these, there are input fields for roCommunity (public), rwCommunity (private), TrapSink, Trap2Sink, InformSink, Sys Name (WEP-2L), Sys Contact (Contact), Sys Location (Russia), and Trap Community (trap). At the bottom, there are 'Apply' and 'Cancel' buttons.

- To enable access to the device via the web interface via HTTP protocol, set the flag next to “WEB”. In the window that appears, it is possible to change the HTTP port (by default, 80). The range of acceptable values of ports, in addition to the default, from 1025 to 65535 inclusive;
- To enable access to the device via the web interface via HTTPS protocol, set the flag next to “WEB-HTTPS”. In the window that appears, it is possible to change the HTTPS port (by default, 443). The range of acceptable values of ports, in addition to the default, from 1025 to 65535 inclusive;

✔ Note that the ports for the HTTP and HTTPS protocols should not have the same value.

WEP-2L software allows monitoring status of the device and it's sensors via SNMP. In the SNMP submenu, you can configure settings of SNMP agent. The device supports SNMPv1 and SNMPv2 protocol version.

To change the SNMP settings, check the box next to “SNMP”, apply the configuration and then go to the SNMP submenu.

- *roCommunity* — a password to read the parameters (by default: *public*);
- *rwCommunity* — a password to configure (write) parameters (by default: *private*);

- *TrapSink* – IP address or domain name of SNMPv1-trap message recipient in HOST [COMMUNITY [PORT]] format;
- *Trap2Sink* – IP address or domain name of SNMPv2-trap message recipient in HOST [COMMUNITY [PORT]] format;
- *InformSink* – IP address or domain name of Inform message recipient in HOST [COMMUNITY [PORT]] format;
- *Sys Name* – device name;
- *Sys Contact* – device vendor contact information;
- *Sys Location* – device location information;
- *Trap community* – password enclosed in traps (default value: trap).

The list of objects which are supported for reading and configuration via SNMP is given below:

- eltexLtd.1.127.1 – monitoring access point parameters and connected client devices;
- eltexLtd.1.127.3 – access point management (reboot).

where eltexLtd – 1.3.6.1.4.1.35265 is Eltex Enterprise ID.

To apply a new configuration and save setting to non-volatile memory, press “Apply”. Press “Cancel” to discard the changes.

5.9 The “External Services” menu

5.9.1 The “Captive Portal” submenu

The “**Captive Portal**” submenu is designed to enable and configure the APB service at the access point.

The APB service is used to provide portal roaming of clients between access points connected to the service.

The screenshot shows the WEP-2L web interface. At the top, there's a navigation bar with tabs: Monitoring, Radio, VAP, WDS, Network Settings, External Services (selected), and System. On the right of the navigation bar, there's a language dropdown set to 'en' and a '(logout)' link. Below the navigation bar, the 'Captive Portal' submenu is active. It contains an 'Enable' checkbox which is checked, and a 'Roaming Service URL' text input field containing the value 'ws://192.168.1.1:8090/apb/broadc'. At the bottom of the form, there are two buttons: 'Apply' (with a checkmark icon) and 'Cancel' (with an 'X' icon).

- *Enable* – when checked, the point will connect to the APB service, the address of which is specified in the “Roaming Service URL” field, to provide portal roaming of clients;
- *Roaming Service URL* – APB service address to support roaming in the portal authorization mode. Set in format: “ws://<host>:<port>/apb/broadcast”.

To apply a new configuration and save setting to non-volatile memory, click “Apply”. Click “Cancel” to discard the changes.

5.10 The “System” menu

In the “**System**” menu you can configure system, time, device access via different protocols, change password and update device firmware.

5.10.1 The “Device Firmware Upgrade” submenu

The “**Device Firmware Upgrade**” submenu is intended for upgrading the device's firmware.

The screenshot shows the ELTEX WEP-2L web interface. The top navigation bar includes links for Monitoring, Radio, VAP, WDS, Network Settings, External Services, and System (which is highlighted). On the right of the navigation bar are language settings (en) and a (logout) link. The left sidebar under 'Device Firmware Upgrade >' contains links for Configuration, Reboot, Password, Log, and Date and Time. The main content area displays the 'Active Version' and 'Backup Version' of the firmware, both showing '1.0.0.00000000'. A 'Set Active' button is next to the Backup Version. Below this, a message states: 'The latest firmware version is available at: <http://eltex-co.ru/support/downloads/>'. The 'Firmware Image' section has a 'Browse...' button and the text 'No file selected.'. At the bottom of this section is a 'Start Upgrading' button.

- *Active Version* — installed firmware version, which is operating at the moment;
- *Backup version* — installed firmware version which can be used in case of problems with the current active firmware version;
 - *Set active* — a button that allows you to make a backup version of the firmware active, this will require a reboot of the device. The active firmware version will not be set as a backup.

Firmware update

Download the firmware file from <http://eltex-co.com/support/downloads/> and save it on your computer. To do this, click the “Browse” button in the Firmware Image field and specify the path to the firmware file in .tar.gz format.

To start the update process, you must click the “Start Upgrading” button. The process may take several minutes (its current status will be shown on the page). The device will be automatically rebooted when the update is completed.

 **Do not switch off or reboot the device during the firmware update.**

5.10.2 The “Configuration” submenu

In the “**Configuration**” submenu you can save and update current configuration.

Backup Configuration

To save current device configuration to local computer click on the “Download” button.

Restore Configuration

To download the configuration file saved on the local computer, use the *Restore Configuration* item. To update the device configuration click the “Browse” button, specify a file (in .tar.gz format) and click the “Upload” button. Uploaded configuration will be applied automatically and does not require device reboot.

To change the passwords open the configuration file in text editor and change passwords. Then save the changes in configuration archive. The example of password changing is shown below:

Reset to Default Configuration

To reset all the settings to default values, press “Reset” button. If the flag “Save access setting” is activated, then those settings, configurations that are responsible for access to the device (IP address settings, Telnet/SSH/SNMP/Netconf/Web access settings) will be saved

5.10.3 The “Reboot” submenu

To reboot the device, click on the “Reboot” button. The device reboot process takes about 1 minute.

5.10.4 The “Password” submenu

When logging in via web interface administrator (default password: **password**) has the full access to the device: read/write any settings, full device status monitoring.

To change the password, enter the new password first in the “Password” field, then in the “Confirm Password” field and click the “Apply” button to save the new password.

The screenshot shows the WEP-2L web interface with the 'System' tab selected. On the left sidebar, the 'Password' option is highlighted. The main content area contains two input fields: 'Password' and 'Confirm Password', each with a toggle icon to the right. Below these fields are two buttons: 'Apply' (with a checkmark icon) and 'Cancel' (with an 'X' icon).

5.10.5 The “Log” submenu

The “Log” submenu is designed to configure the output of various kinds of debugging messages of the system in order to detect the causes of problems in the operation of the device.

The screenshot shows the WEP-2L web interface with the 'System' tab selected. On the left sidebar, the 'Log' option is highlighted. The main content area contains a 'Mode' dropdown menu set to 'Server and File'. Below it are three input fields: 'Syslog Server Address' (containing 'syslog.server'), 'Syslog Server Port' (containing '514'), and 'File Size, KiB' (containing '1000'). At the bottom are 'Apply' and 'Cancel' buttons.

- **Mode** — Syslog agent operation mode:
 - *Local File* — log information is stored in a local file and is available in the device’s web interface on the “Monitoring/Events” tab;
 - *Server and File* — log information is sent to a remote Syslog server and stored in a local file.
- **Syslog Server Address** — IP address or domain name of the Syslog server;
- **Syslog Server Port** — port for incoming Syslog server messages (default: 514, valid values: from 1 to 65535);
- **File Size, KiB** — maximum size of the log file (valid values: 1-1000 kB).

To apply a new configuration and save setting to non-volatile memory, click “Apply”. Click “Cancel” to discard the changes.

5.10.6 The “Date and Time” submenu

In the “Date and Time” submenu, you can set the time manually or using the time synchronization protocol (NTP).

Manual

The screenshot shows the WEP-2L web interface with the 'System' tab selected. The left sidebar contains a menu with 'Date and Time >' highlighted. The main content area is titled 'Date and Time' and shows the following settings:

- Mode:** ☒ Manual, ☐ NTP Server
- Date and Time device:** 13.12.2021 11:26:11 (with an 'Edit' button)
- Time Zone:** Novosibirsk (dropdown menu)
- Enable daylight saving time:** ☒
- DST Start:** (not selected) (not selected) in (not selected) at -- : --
- DST End:** (not selected) (not selected) in (not selected) at -- : --
- DST Offset (minutes):** 60 (spinner)

At the bottom, there are 'Apply' and 'Cancel' buttons.

- **Date and Time device** — date and time set on the device. Click on the “Edit” button if the correction is necessary;
 - **Date, Time** — set the current date and time or click the “Set current date and time” button to synchronize with the device.
- **Time Zone** — allows to set the timezone according to the nearest city for your region from the list;
- **Daylight Saving Time Enable** — when selected, automatic daylight saving change will be performed automatically within the defined time period:
 - **DST Start** — day and time, when daylight saving time is starting;
 - **DST End** — day and time, when daylight saving time is ending;
 - **DST Offset (minutes)** — time period in minutes, on which time offset is performing. May take values from 0 to 720 minutes.

NTP Server

The screenshot shows the WEP-2L web interface with the 'System' tab selected. The left sidebar contains a menu with 'Date and Time >' highlighted. The main content area is titled 'Date and Time' and shows the following settings:

- Mode:** ☐ Manual, ☒ NTP Server
- Date and Time device:** 13.12.2021 11:26:38
- NTP Server:** pool.ntp.org (dropdown menu)
- Time Zone:** Novosibirsk (dropdown menu)
- Enable daylight saving time:** ☒
- DST Start:** (not selected) (not selected) in (not selected) at -- : --
- DST End:** (not selected) (not selected) in (not selected) at -- : --
- DST Offset (minutes):** 60 (spinner)

At the bottom, there are 'Apply' and 'Cancel' buttons.

- *Date and Time device* – date and time set on the device;
- *NTP Server* – time synchronization server IP address/domain name. You can specify an address or select from an existing list;
- *Time Zone* – allows to set the timezone according to the nearest city for your region from the list;
- *Daylight Saving Time Enable* – when selected, automatic daylight saving change will be performed automatically within the defined time period:
 - *DST Start* – day and time, when daylight saving time is starting;
 - *DST End* – day and time, when daylight saving time is ending;
 - *DST Offset (minutes)* – time period in minutes, on which time offset is performing.

To apply a new configuration and store settings into the non-volatile memory, click the *“Apply” button*. To discard changes click the *“Cancel” button*.

6 Managing the device using the command line

- ✓ To display the existing settings of a particular configuration section, enter the **show-config** command. Press the key combination (English layout) – **[Shift + ?]** to get a hint of what value this or that configuration parameter can take.
To get a list of options available for editing in this configuration section, press the **Tab** key.
To save the settings, enter the **save** command.
To go back to the previous configuration section, enter the **exit** command.

6.1 Connection to the device

By default, WEP-2L is configured to receive the address via DHCP. If this does not happen, you can connect to the device using the factory IP address.

- ✓ WEP-2L factory default IP address: **192.168.1.10**, subnet mask: **255.255.255.0**.

Connection to the device is performed via SSH/Telnet:

```
ssh admin@<IP address of the device>, then enter the password  
telnet <IP address of the device>, enter login and password
```

6.2 Network parameters configuration

Configuration of access point static network parameters

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# br0
WEP-2L(config):/interface/br0# common
WEP-2L(config):/interface/br0/common# static-ip X.X.X.X (where X.X.X.X – WEP-2L IP address)
WEP-2L(config):/interface/br0/common# netmask X.X.X.X (where X.X.X.X – Subnet mask)
WEP-2L(config):/interface/br0/common# dns-server-1 X.X.X.X (where X.X.X.X – IP address of the dns server №1)
WEP-2L(config):/interface/br0/common# dns-server-2 X.X.X.X (where X.X.X.X – IP address of the dns server №2)
WEP-2L(config):/interface/br0/common# protocol static-ip (Change operation mode from DHCP to Static-IP)
WEP-2L(config):/interface/br0/common# save (Save configuration)
```

Static routing

```
WEP-2L(config):/interface/br0/common# exit
WEP-2L(config):/interface/br0# exit
WEP-2L(config):/interface# exit
WEP-2L(config):/# route
WEP-2L(config):/route# add default (where default – route name)
WEP-2L(config):/route# default
WEP-2L(config):/route/default# destination X.X.X.X (where X.X.X.X – IP address of the network or destination node, for default route – 0.0.0.0)
WEP-2L(config):/route/default# netmask X.X.X.X (where X.X.X.X – destination network mask, for default route – 0.0.0.0)
WEP-2L(config):/route/default# gateway X.X.X.X (where X.X.X.X – gateway IP address)
WEP-2L(config):/route/default# save (Save changes)
```

Configuration of reception of the network parameters via DHCP

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# br0
WEP-2L(config):/interface/br0# common
WEP-2L(config):/interface/br0/common# protocol dhcp
WEP-2L(config):/interface/br0/common# save (Save changes)
```

6.2.1 Network parameters configuration via set-management-vlan-mode utility

Untagged access

Reception of the network parameters via DHCP:

WEP-2L(root):/# **set-management-vlan-mode off protocol dhcp**

Static settings:

WEP-2L(root):/# **set-management-vlan-mode off protocol static-ip ip-addr X.X.X.X netmask Y.Y.Y.Y gateway Z.Z.Z.Z** (where X.X.X.X – static IP address, Y.Y.Y.Y – subnet mask, Z.Z.Z.Z – gateway)

Access via Management VLAN in Terminating mode

Reception of the network parameters via DHCP:

WEP-2L(root):/# **set-management-vlan-mode terminating vlan-id X protocol dhcp** (where X – VLAN ID used for access to the device. Possible values: 1-4094)

Static settings:

WEP-2L(root):/# **set-management-vlan-mode terminating vlan-id X protocol static-ip ip-addr X.X.X.X netmask Y.Y.Y.Y gateway Z.Z.Z.Z** (where X – VLAN ID used for access to the device. Possible values: 1-4094; X.X.X.X – static IP address, Y.Y.Y.Y – subnet mask, Z.Z.Z.Z – gateway)

Access via Management VLAN in Forwarding mode

Reception of the network parameters via DHCP:

WEP-2L(root):/# **set-management-vlan-mode forwarding vlan-id X protocol dhcp** (where X – VLAN ID used for access to the device. Possible values: 1-4094)

Static settings:

WEP-2L(root):/# **set-management-vlan-mode forwarding vlan-id X protocol static-ip ip-addr X.X.X.X netmask Y.Y.Y.Y gateway Z.Z.Z.Z** (where X – VLAN ID used for access to the device. Possible values: 1-4094; X.X.X.X – static IP address, Y.Y.Y.Y – subnet mask, Z.Z.Z.Z – gateway)

Completion and changes save

WEP-2L(root):/# **save** (Save changes)

6.2.2 IPv6 network parameters configuration

❗ Access to the device via IPv6 protocol is disabled by default.
Access to the device via IPv6 protocol is possible to configure only if VLAN management is not used on the access point.

Enabling access to the device via IPv6 protocol

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# br0
WEP-2L(config):/interface/br0# common
WEP-2L(config):/interface/br0/common# ipv6
WEP-2L(config):/interface/br0/common/ipv6# protocol dhcp (Reception of the IPv6 network parameters via DHCP)
WEP-2L(config):/interface/br0/common/ipv6# enabled true (Enabling access to the device via IPv6 protocol. To disable, enter false)
WEP-2L(config):/interface/br0/common/ipv6# save (Save changes)
```

Configuring static IPv6 network settings for the access point

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# br0
WEP-2L(config):/interface/br0# common
WEP-2L(config):/interface/br0/common# ipv6
WEP-2L(config):/interface/br0/common/ipv6# address
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX (where
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX – static IPv6 address of the WEP-2L device)
WEP-2L(config):/interface/br0/common/ipv6# address-prefix-length X (where X – static IPv6 address prefix. Takes values from 0 to 128. By default – 64)
WEP-2L(config):/interface/br0/common/ipv6# gateway XXXX:XXXX:XXXX:XXXX::/64 (IPv6 prefix is specified, for example 3211:0:0:1234::/64)
WEP-2L(config):/interface/br0/common/ipv6# dns-server-1
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX/Y (where
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX/Y – IPv6 address of the dns server №1 with prefix)
WEP-2L(config):/interface/br0/common/ipv6# dns-server-2
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX/Y (where
XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX:XXXX/Y – IPv6 address of the dns server №2 with prefix)
WEP-2L(config):/interface/br0/common/ipv6# protocol static-ip (Enabling use of static IPv6 networks parameters. For reception of IPv6 the network parameters via DHCP enter dhcp)
WEP-2L(config):/interface/br0/common/ipv6# enabled true (Enabling access to the device via IPv6 protocol. To disable enter false)
WEP-2L(config):/interface/br0/common/ipv6# save (Save changes)
```

6.3 Virtual Wi-Fi access points (VAP) configuration

When configuring a VAP, remember that the interface names in the 2.4 GHz range start with wlan0, in the 5 GHz range with wlan1.

Table 8 — Commands for configuration of security mode on VAP

Security mode	Command to set the security mode
Without password	security-mode off
WPA	security-mode WPA
WPA2	security-mode WPA2
WPA/WPA2	security-mode WPA_WPA2
WPA-Enterprise	security-mode WPA_1X
WPA2-Enterprise	security-mode WPA2_1X
WPA/WPA2-Enterprise	security-mode WPA_WPA2_1X

Below are examples of VAP configuration with different security modes for Radio 5 GHz (wlan1).

6.3.1 Configuration of VAP without encryption

Creation of VAP without encryption

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan1-va0
WEP-2L(config):/interface/wlan1-va0# vap
WEP-2L(config):/interface/wlan1-va0/vap# ssid 'SSID_WEP-2L_open' (Change SSID name)
WEP-2L(config):/interface/wlan1-va0/vap# security-mode off (Encryption mode off – Without password)
WEP-2L(config):/interface/wlan1-va0/common# exit
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true (Enable VAP)
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)
```

6.3.2 Configuration of VAP with WPA-Personal security mode

Creation of VAP with WPA-Personal security mode

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan1-va0
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true (Enable VAP)
WEP-2L(config):/interface/wlan1-va0/common# exit
WEP-2L(config):/interface/wlan1-va0# vap
WEP-2L(config):/interface/wlan1-va0/vap# ssid 'SSID_WEP-2L_Wpa2' (Change SSID name)
WEP-2L(config):/interface/wlan1-va0/vap# security-mode WPA_WPA2 (Encryption mode – WPA/WPA2)
WEP-2L(config):/interface/wlan1-va0/vap# key-wpa password123 (Key/password required to connect to
the virtual access point. The key must be between 8 and 63 characters long.)
WEP-2L(config):/interface/wlan1-va0/vap# save
```

6.3.3 Configuration of VAP with Enterprise authorization

Creation of VAP with WPA2-Enterprise security mode with periodic accounting to RADIUS server

```

WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan1-va0
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true (Enable VAP)
WEP-2L(config):/interface/wlan1-va0/common# exit
WEP-2L(config):/interface/wlan1-va0# vap
WEP-2L(config):/interface/wlan1-va0/vap# ssid 'SSID_WEP-2L_enterprise' (Change SSID name)
WEP-2L(config):/interface/wlan1-va0/vap# security-mode WPA_WPA2_1X (Encryption mode – WPA/
WPA2-Enterprise)
WEP-2L(config):/interface/wlan1-va0/vap# radius
WEP-2L(config):/interface/wlan1-va0/vap/radius# domain root (where root – User domain)
WEP-2L(config):/interface/wlan1-va0/vap/radius# auth-address X.X.X.X (where X.X.X.X – RADIUS server
IP address)
WEP-2L(config):/interface/wlan1-va0/vap/radius# auth-port X (where X – RADIUS server port, used for
authentication and authorization. By default: 1812)
WEP-2L(config):/interface/wlan1-va0/vap/radius# auth-password secret (where secret – Password for
RADIUS server, used for authentication and authorization)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-enable true (Enable the sending of “Accounting”
messages to the RADIUS server. By default: false)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-address X.X.X.X (where X.X.X.X – RADIUS server
IP address, used for accounting)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-password secret (where secret – Password for
RADIUS server, used for accounting)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-periodic true (Enable the periodic sending of
“Accounting” messages to the RADIUS server. By default: false)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-interval 600 (Interval of sending of “Accounting”
messages to the RADIUS server)
WEP-2L(config):/interface/wlan1-va0/common# exit
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true (Enable VAP)
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)

```

6.3.4 Configuration of VAP with Captive Portal

Commands to configure portal authorization by sending your account to the Radius server

```

WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan1-va0
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true
WEP-2L(config):/interface/wlan1-va0/common# exit
WEP-2L(config):/interface/wlan1-va0# vap
WEP-2L(config):/interface/wlan1-va0/vap# vlan-id X (where X – VLAN-ID on VAP)
WEP-2L(config):/interface/wlan1-va0/vap# security-mode off (Encryption mode off – Without password)
WEP-2L(config):/interface/wlan1-va0/vap# ssid 'Portal_WEP-2L' (Change SSID name)
WEP-2L(config):/interface/wlan1-va0/vap# captive-portal
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal# scenarios
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios# scenario-redirect
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios/scenario-redirect# redirect-url http://<IP>:<PORT>/eltex_portal/ (Specify virtual portal URL)
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios/scenario-redirect# index 1
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios/scenario-redirect# virtual-portal-name default (Specify portal name. By default: default)
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios/scenario-redirect# exit
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal/scenarios# exit
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal# enabled true
WEP-2L(config):/interface/wlan1-va0/vap/captive-portal# exit
WEP-2L(config):/interface/wlan1-va0/vap# radius
WEP-2L(config):/interface/wlan1-va0/vap/radius# domain root (where root – User domain)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-enable true (Enable the sending of “Accounting” messages to the RADIUS server. By default: false)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-address X.X.X.X (where X.X.X.X – RADIUS server IP address, used for accounting)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-password secret (where secret – Password for RADIUS server, used for accounting)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-periodic true (Enable the periodic sending of “Accounting” messages to the RADIUS server. By default: false)
WEP-2L(config):/interface/wlan1-va0/vap/radius# acct-interval 600 (Interval of sending of “Accounting” messages to the RADIUS server)
WEP-2L(config):/interface/wlan1-va0/vap# exit
WEP-2L(config):/interface/wlan1-va0# common
WEP-2L(config):/interface/wlan1-va0/common# enabled true (Enabling virtual access point)
WEP-2L(config):/interface/wlan1-va0/common# save (Save changes)

```

6.3.5 Advanced VAP settings

Enabling VLAN ID on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **vlan-id X** (where X – VLAN-ID number on VAP)

Enabling Band Steer mode

WEP-2L(config):/interface/wlan1-va0/vap# **band-steer-mode true** (Enabling Band Steer mode. To disable, enter **false**)

Enabling VLAN trunk on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **vlan-trunk true** (Enabling VLAN trunk on VAP. To disable, enter **false**)

Enabling General VLAN on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **general-vlan-mode true** (Enabling General VLAN on SSID. To disable, enter **false**)

WEP-2L(config):/interface/wlan1-va0/vap# **general-vlan-id X** (where X – General VLAN number)

Selection of the prioritization method

WEP-2L(config):/interface/wlan1-va0/vap# **priority-by-dscp false** (Priority analysis from CoS field (Class of Service) tagged packets. Value by default: **true**. In this case, DSCP header field of the IP packet is analyzed)

Enabling use of TLS at authorization

WEP-2L(config):/interface/wlan1-va0/vap/radius# **tls-enable true** (Enabling use of TLS at authorization. To disable, enter **false**)

Enabling hidden SSID

WEP-2L(config):/interface/wlan1-va0/vap# **hidden true** (Enabling hidden SSID. To disable, enter **false**)

Client limitation on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **sta-limit X** (where X is the maximum allowable number of clients connected to the virtual network)

Limiting the number of clients on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **sta-limit X** (where X — maximum allowed number of clients connected to the virtual network)

Enabling client isolation on VAP

WEP-2L(config):/interface/wlan1-va0/vap# **station-isolation true** (Enable traffic isolation between clients within a single VAP. To disable, enter **false**)

Enabling Minimal Signal

WEP-2L(config):/interface/wlan1-va0/vap# **minimal-signal -X** (where X — RSSI threshold, when reached, the point will disconnect the client from the VAP. The parameter can take values from -100 to 0.)

Enabling subscribers traffic transmission outside of GRE tunnel

WEP-2L(config):/interface/wlan1-va0/vap/radius# **local-switching true** (Enabling subscribers traffic transmission outside of GRE tunnel. To disable, enter **false**)

Configuring speed limit

Configuring shaper for outbound customers' traffic (each separately) connected to this VAP:

```
WEP-2L(config):/interface/wlan1-va0/vap# shaper-per-sta-rx
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-rx# value X (where X — maximum speed in kbps)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-rx# mode kbps (Enabling shaper. To disable, enter off)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-rx# exit
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)
```

Configuring shaper for customers' traffic (each separately) connected to this VAP:

```
WEP-2L(config):/interface/wlan1-va0/vap# shaper-per-sta-tx
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-tx# value X (where X — maximum speed in kbps)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-tx# mode kbps (Enabling shaper. To disable, enter off)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-sta-tx# exit
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)
```

Configuring shaper for outbound customers' traffic (in total) connected to this VAP:

```
WEP-2L(config):/interface/wlan1-va0/vap# shaper-per-vap-rx
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-rx# value X (where X — maximum speed in kbps)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-rx# mode kbps (Enabling shaper. To disable, enter off)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-rx# exit
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)
```

Configuring shaper for inbound customers' traffic (in total) connected to this VAP:

```
WEP-2L(config):/interface/wlan1-va0/vap# shaper-per-vap-tx
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-tx# value X (where X — maximum speed in kbps)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-tx# mode kbps (Enabling shaper. To disable, enter off)
WEP-2L(config):/interface/wlan1-va0/vap/shaper-per-vap-tx# exit
WEP-2L(config):/interface/wlan1-va0/vap# save (Save changes)
```

802.11r configuration

This type of roaming is available only for customers' devices supporting 802.11r.

802.11r roaming is possible only between VAP with WPA2-Personal and WPA2-Enterprise security modes.

VAP configuration with WPA2-Personal security mode manual and others can be seen in section Configuration of VAP with WPA-Personal security mode.

Each VAP on the access points should be configured individually, eg. AP1(wlan1) ↔ AP2(wlan1), AP1(wlan0) ↔ AP2(wlan0), AP1(wlan1) ↔ AP3(wlan1), etc.

Below is the example of 802.11r configuring on two access points: AP1 and AP2.

Configuring 802.11r on AP1

```
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# enabled false
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# r1-key-holder-id E8:28:C1:FC:D6:80 (MAC address
of VAP. Can be viewed in ifconfig output)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# r0-key-holder-id 12345 (Unique key for this VAP)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# mobility-domain 100 (Domain must match on
oncoming VAPs)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# mac
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# add E4:5A:D4:E2:C4:B0 (MAC address of VAP
interface of oncoming access point – AP2)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# E4:5A:D4:E2:C4:B0
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E4:5A:D4:E2:C4:B0# r0-kh-id 23456 (Unique key
of oncoming VAP access point AP2 – r0-key-holder-id)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E4:5A:D4:E2:C4:B0# r1-kh-
id E4:5A:D4:E2:C4:B0 (MAC address of oncoming VAP on AP2)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E4:5A:D4:E2:C4:B0# r0-kh-key
0102030405060708 (Random key. Must not match r1-kh-key AP1, but necessarily must match r1-kh-key
of oncoming AP2)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E4:5A:D4:E2:C4:B0# r1-kh-key
0001020304050607 (Random key. Must not match r0-kh-key AP1, but necessarily must match r0-kh-key
of oncoming AP2)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E4:5A:D4:E2:C4:B0# exit
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# exit
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# enabled true (Enabling access point operation via
802.11r protocol)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# save (Save changes)
```

Configuring 802.11r on AP2

```

WEP-2L(config):/interface/wlan1-va0/vap/ft-config# enabled false
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# r1-key-holder-id E4:5A:D4:E2:C4:B0 (MAC address
of VAP. Can be viewed in ifconfig output)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# r0-key-holder-id 23456 (Unique key for this VAP)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# mobility-domain 100 (Domain must match on
oncoming VAPs)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# mac
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# add E8:28:C1:FC:D6:80 (MAC address of VAP
interface of oncoming access point – AP1)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# E8:28:C1:FC:D6:80
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E8:28:C1:FC:D6:80# r0-kh-id 12345 (Unique key
of oncoming VAP access point AP1 – r0-key-holder-id)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E8:28:C1:FC:D6:80# r1-kh-id E8:28:C1:FC:D6:80
(MAC address of oncoming VAP on AP1)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E8:28:C1:FC:D6:80# r0-kh-key
0001020304050607 (Random key. Must not match r1-kh-key AP2, but necessarily must match r1-kh-key
of oncoming AP1)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E8:28:C1:FC:D6:80# r1-kh-key
0102030405060708 (Random key. Must not match r0-kh-key AP2, but necessarily must match r0-kh-key
of oncoming AP1)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac/E8:28:C1:FC:D6:80# exit
WEP-2L(config):/interface/wlan1-va0/vap/ft-config/mac# exit
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# enabled true (Enabling access point operation via
802.11r protocol)
WEP-2L(config):/interface/wlan1-va0/vap/ft-config# save (Save changes)

```

802.11k configuration

802.11k protocol roaming can be organized between any network (open/secure). If the access point is configured to work under the 802.11k protocol, then when a customer connects, the access point sends them the list of “friendly” access points to which a customer can switch in a roaming process. The list contains information about access points' MAC addresses and channels they work with.

Use of 802.11k allows to reduce the time that the spends looking for another network when roaming, since the customer does not need to scan channels on which there are no target access points available for switching.

This type of roaming is available only for customers' devices supporting 802.11k.

Below is the example of 802.11k configuring access point — making a list of “friendly” access points.

802.11k configuring

```
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config# enabled false
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config# mac
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac# add E8:28:C1:FC:D6:90 (where
E8:28:C1:FC:D6:90 — MAC address of “friendly” access point)
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac# E8:28:C1:FC:D6:90
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac/E8:28:C1:FC:D6:90# channel 132
(where 132 — channel on which access point with E8:28:C1:FC:D6:90 MAC address operates)
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac/E8:28:C1:FC:D6:90# exit
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac# add E8:28:C1:FC:D6:70 (where
E8:28:C1:FC:D6:70 — MAC address of “friendly” access point)
WEP-2Lx(config):/interface/wlan1-va0/vap/w80211kv-config/mac# E8:28:C1:FC:D6:70
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac/E8:28:C1:FC:D6:70# channel 36 (where
36 — channel on which access point with E8:28:C1:FC:D6:70 MAC address operates)
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac/E8:28:C1:FC:D6:70# exit
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config/mac# exit
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config# enabled true (Enabling access point
operation via 802.11k protocol)
WEP-2L(config):/interface/wlan1-va0/vap/w80211kv-config# save (Save changes)
```

6.4 Radio settings

In the Radio section, automatic selection of the working channel is used by default. To set the channel manually and change the power, use the following commands:

Change of operation channel and radio interface power

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan0
WEP-2L(config):/interface/wlan0# wlan
WEP-2L(config):/interface/wlan0/wlan# radio-2g (for wlan1 section is called radio-5g)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# channel X (where X – number of the static channel on
which the point will operate)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# auto-channel false (Disable Auto Channel. To enable,
enter true)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# use-limit-channels false (Disable Use Limit Channels.
To enable, enter true)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# bandwidth X (where X – channel width. Parameter can
take the following value: for Radio 1: 20, 40; Radio 2: 20, 40, 80)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# tx-power X (where X – power level, dBm. Parameter
can take the following value: for Radio 1: 11-16 dBm; for Radio 2: 11-19 dBm)
WEP-2L(config):/interface/wlan0/wlan/radio-2g# save (Save changes)
```

✓ Lists of available channels

Channels available for selection for radio 2.4 GHz :

- for 20 MHz channel width: 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13.
- for 40 MHz channel width:
 - if “control-sideband” = lower: 1, 2, 3, 4, 5, 6, 7, 8, 9.
 - if “control-sideband” = upper: 5, 6, 7, 8, 9, 10, 11, 12, 13.

Channels available for selection for radio 5 GHz:

- for 20 MHz channel width: 36, 40, 44, 48, 52, 56, 60, 64, 132, 136, 140, 144, 149, 153, 157, 161, 165.
- for 40 MHz channel width:
 - if “control-sideband” = lower: 36, 44, 52, 60, 132, 140, 149, 157.
 - if “control-sideband” = upper: 40, 48, 56, 64, 136, 144, 153, 161.
- for 80 MHz channel width: 36, 40, 44, 48, 52, 56, 60, 64, 132, 136, 140, 144, 149, 153, 157, 161.

6.4.1 Advanced Radio settings

Configuring the limited list of channels

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **use-limit-channels true** (Enabling use of limited list of channels in channel autoselection operation. To disable, enter **false**)

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **limit-channels '1 6 11'** (where 1, 6, 11 are channels of range in which the configurable radio interface can operate)

Changing the primary channel

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **control-sideband lower** (Parameter may take values: lower, upper. By default: for Radio 1: lower; for Radio 2: upper)

Enabling the use of Short Guard Interval

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **sgi true** (Switching on the use of a Short Guard Interval for data transmission of 400 ns instead of 800 ns. To disable, enter **false**)

Enabling STBC

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **stbc true** (Enabling the Spatial-Time Block Coding (STBC) method, aimed at improving the reliability of data transmission. To disable, enter **false**)

Enabling aggregation

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **aggregation true** (Enabling aggregation on Radio — support for AMPDU/AMSDU. To disable, enter **false**)

Enabling the short preamble

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **short-preamble true** (Enabling the short packet preamble. To disable, enter **false**)

Enabling the Wi-Fi Multimedia (WMM)

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **wmm true** (Enabling the support for WMM (Wi-Fi Multimedia) To disable, enter **false**)

Configuring DFS mechanism

Configuring is done only on Radio 5 GHz (wlan1)

WEP-2L(config):/interface/wlan1/wlan/radio-5g# **dfs X** (where X – DFS mechanism operating mode. May take values: **forced** – the mechanism is disabled, DFS channels available for selection; **auto** – the mechanism is enabled; **disabled** – the mechanism is disabled, DFS channels unavailable for selection)

Enabling automatic channel width switch mode

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **obss-coex true** (Enabling automatic channel width switch mode from 40 MHz to 20 MHz with a busy radio environment. To disable, enter **false**)

Changing the channel bandwidth

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **bandwidth X** (where X – bandwidth. Parameter can take the following value: for Radio 1: 20, 40; Radio 2: 20, 40, 80)

Enabling Broadcast/Multicast shaper

WEP-2L(config):/interface/wlan0/wlan/radio-2g# **tx-broadcast-limit X** (where X – Restricting broadcast/multicast traffic over the wireless network, specify a limit for broadcast traffic per packet/s)

Enabling QoS and parameter changes

```

WEP-2L(config):/interface/wlan0/wlan/radio-2g# qos
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos# enable true (Enabling the use of Quality of Service
functions.) To disable, enter false )
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos# edca-ap (Configuring the access point's QoS
parameters (traffic is transmitted from the access point to the client))
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap# bk (Configure QoS parameters for low-
priority high-bandwidth queues (802.1p priorities: cs1, cs2))
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap/bk# aifs X (where X – the time frame(s) of
data measured in slots. Takes the values: 1-255)
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap/bk# cwmin X (X – The initial value of the
waiting time before sending the frame again is set in milliseconds. Takes the following values: 1, 3, 7, 15,
31, 63, 127, 255, 511, 1023. The value of cwMin may not exceed the value of cwMax)
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap/bk# cwmax X (where X – The maximum
waiting time before resending a frame is set in milliseconds. Takes the following values: 1, 3, 7, 15, 31, 63,
127, 255, 511, 1023. The value of cwMax must be greater than the value of cwMin)
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap/bk# txop X (where X – The time interval, in
milliseconds, in which the client WME station is allowed to initiate data transmission over the wireless
environment to the access point. Max value – 65535 ms)
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap/bk# exit
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos/edca-ap# exit
WEP-2L(config):/interface/wlan0/wlan/radio-2g/qos# edca-sta (Configuring the client station QoS
parameters (traffic is transmitted from the client station to the access point))

```

The configuration method of **edca-sta** is the same as that of **edca-ap**.

Parameters configuration for queues **be**, **vi**, **vo** is similar to parameters configuration for queue **bk**.

6.5 WDS configuring

- ✓ When configuring WDS connection, it is necessary that the same channel and channel width are selected in the radio interface settings on the devices that will connect via WDS. For more information on configuring the radio interface via the command line, see the Radio Settings section.

Configuring WDS connection on Radio 5 GHz interface (wlan1) is given below.

WDS configuring

```
WEP-2L(root):/# configure
WEP-2L(config):/# interface
WEP-2L(config):/interface# wlan1-wds0 (Selecting WDS link. Possible values for Radio 2,4 GHz: wlan0-wds0 — wlan0-wds3); for Radio 5 GHz : wlan1-wds0 — wlan1-wds3)
WEP-2L(config):/interface/wlan1-wds0# wds-5 (When configuring WDS on Radio 2,4 GHz, enter wds-2)
WEP-2L(config):/interface/wlan1-wds0/wds-5# mac-addr XX:XX:XX:XX:XX:XX (MAC address of oncoming access point Radio interface, which can be viewed if entering the command monitoring radio-2 or monitoring radio-5 on the oncoming access point, depending on which range the configured WDS connection will operate in)
WEP-2L(config):/interface/wlan1-wds0/wds-5# exit
WEP-2L(config):/interface/wlan1-wds0# common
WEP-2L(config):/interface/wlan1-wds0/common# enabled true (Enabling WDS link. To disable, enter false)
WEP-2L(config):/interface/wlan1-wds0/common# exit
WEP-2L(config):/interface/wlan1-wds0# exit
WEP-2L(config):/interface# wlan1 (When configuring WDS on Radio 2,4 GHz, enter wlan0)
WEP-2L(config):/interface/wlan1# wlan
WEP-2L(config):/interface/wlan1/wlan# wds
WEP-2L(config):/interface/wlan1/wlan/wds# security-mode WPA2 (Selecting WPA2 security mode. Possible values: WPA, off — without password)
WEP-2L(config):/interface/wlan1/wlan/wds# key-wpa password123 (Key/password, necessary for connection to the oncoming access point. . Key length is from 8 to 63 characters)
WEP-2L(config):/interface/wlan1/wlan/wds# enabled true (Enabling WDS. To disable, enter false)
WEP-2L(config):/interface/wlan1/wlan/wds# save
```

6.6 System settings

6.6.1 Device firmware update

Device firmware update via tftp

```
WEP-2L(root):/# firmware upload tftp <tftp server IP address> <Firmware image name> (Example: firmware upload
tftp 192.168.1.15 WEP-2L-1.2.1_build_X.tar.gz)
WEP-2L(root):/# firmware upgrade
```

Device firmware update via http

```
WEP-2L(root):/# firmware upload http <URL to download Firmware image> (Example: firmware upload http http://
192.168.1.100:8080/files/WEP-2L-1.2.1_build_X.tar.gz)
WEP-2L(root):/# firmware upgrade
```

Switching to access point firmware backup

```
WEP-2L(root):/# firmware switch
```

6.6.2 Device configuration management

Resetting the device configuration to a default state without saving the access parameters

```
WEP-2L(root):/# manage-config reset-to-default
```

Resetting the device configuration to a default state with saving the access parameters

```
WEP-2L(root):/# manage-config reset-to-default-without-management
```

Download the device configuration file to tftp server

```
WEP-2L(root):/# manage-config download tftp <tftp server IP address> (Example: manage-config download tftp
192.168.1.15)
```

Download configuration file from tftp server to the device

```
WEP-2L(root):/# manage-config upload tftp <tftp server IP address> <Configuration file name>
(Example: manage-config upload tftp 192.168.1.15 config.json)
WEP-2L(root):/# manage-config apply (Apply configuration to the access point)
```

6.6.3 Device reboot

The command for rebooting the device.

```
WEP-2L(root):/# reboot
```

6.6.4 Setting the date and time

Commands to configure NTP server time synchronization

```
WEP-2L(root):/# configure
WEP-2L(config):/# date-time
WEP-2L(config):/date-time# mode ntp (Enable NTP operation mode)
WEP-2L(config):/date-time# ntp
WEP-2L(config):/date-time/ntp# server <NTP server IP address> (NTP server configuration)
WEP-2L(config):/date-time/ntp# exit
WEP-2L(config):/date-time# common
WEP-2L(config):/date-time/common# timezone 'Asia/Novosibirsk (Novosibirsk)' (Timezone configuration)
WEP-2L(config):/date-time/common# save
```

6.6.5 Advanced system settings

Enabling global isolation

```
WEP-2L(root):/# configure
WEP-2L(config):/# system
WEP-2L(config):/system# global-station-isolation true (Enabling global traffic isolation between customers of different VAP in different radio interfaces. To disable, enter false)
WEP-2L(config):/system# save (Save changes)
```

Changing device name

```
WEP-2L(root):/# configure
WEP-2L(config):/# system
WEP-2L(config):/system# hostname WEP-2L_room2 (where WEP-2L_room2 — new name of the device. A
parameter can contain from 1 to 63 symbols: capital и lowercase latin letters, nu,bers, hyphen character
“-” (hyphen can not be the last character in name). By default: WEP-2L)
WEP-2L(config):/system# save (Save changes)
```

Changing geographical domain

```
WEP-2L(root):/# configure
WEP-2L(config):/# system
WEP-2L(config):/system# ap-location ap.test.root (where ap.test.root — EMS management system
device tree node domain, where access point is located. By default: root)
WEP-2L(config):/system# save (Save changes)
```

Changing password

```
WEP-2L(root):/# configure
WEP-2L(config):/# authentication
WEP-2L(config):/authentication# admin-password newpassword (where newpassword — new password
to login to the access point. By default: password)
WEP-2L(config):/authentication# save (Save changes)
```

6.7 APB service configuration

The APB service is used to provide portal roaming of clients between access points connected to the service.

Commands for APB service configuration

```
WEP-2L(root):/# configure
WEP-2L(config):/# captive-portal
WEP-2L(config):/captive-portal# apbd
WEP-2L(config):/captive-portal/apbd# roam_service_url <APB service
address> (Example: roam_service_url ws://192.168.1.100:8090/apb/broadcast )
WEP-2L(config):/captive-portal/apbd# enabled true (Enabling APB service. To disable it, enter false)
WEP-2L(config):captive-portal/apbd# save (Save changes)
```

6.8 Monitoring

6.8.1 Wi-Fi Clients

To display monitoring of connected Wi-Fi clients, use the command:

monitoring associated-clients <mac address of client 1> ... <mac address of client N> **filter** <parameter 1> ... <parameter N>,

where <mac address of client 1> ... <mac address of client N> – mac addresses of customer devices, connected to the access point. In order to display information for all customers, instead of <mac address of client> enter **all**;

filter – a special word followed by the monitoring parameters required for withdrawal by client/clients;

<parameter 1> ... <parameter N> – monitoring parameter/parameters, necessary for client/clients display.

To display a list of clients connected to the access point, press Tab after **monitoring associated-clients**.

WEP-2L(root):/# **monitoring associated-clients** <Tab>

```
32:5b:60:62:e0:a4
bc:2e:f6:cc:85:46
all
```

To get a list of monitoring parameters, press Tab after **filter**.

WEP-2L(root):/# **monitoring associated-clients all filter** <Tab>

```
index
interface
ssid
hw-addr
state
ip-addr
hostname
rx-retry-count
tx-fails
tx-period-retry
tx-retry-count
.....
```

Display information on all connected clients

WEP-2L(root):/# **monitoring associated-clients** (or **monitoring associated-clients all**)

```

index                | 0

```

6.8.2 WDS

To monitor WDS connections, use the following command:

monitoring wds-entries <mac address of oncoming access point 1> ... <mac address of oncoming access point N> **filter** <parameter 1> ... <parameter N>, where <mac address of oncoming access point 1> ... <mac address of oncoming access point N> – mac addresses of oncoming access points, with which WDS bridges are built. In order to display information for all oncoming access points, instead of <mac address of oncoming access point> enter **all**;

filter – a special word followed by the monitoring parameters required for display of one or several oncoming access points;

<parameter 1> ... <parameter N> – monitoring parameter/parameters, necessary for display of one or several oncoming access points.

To display a list of access points with which WDS bridges are built, press Tab after **monitoring wds-entries**.

```
WEP-2L(root):/# monitoring wds-entries <Tab>
```

```
e8:28:c1:d1:43:15
e8:28:c1:da:cb:80
all
```

To get a list of monitoring parameters, press Tab after **filter**.

```
WEP-2L(root):/# monitoring wds-entries all filter <Tab>
```

6.8.8 Spectrum Analyzer

The spectrum analyzer provides information on channel utilization in the 2.4 and 5 GHz bands. The result is displayed as a percentage.

⚠ Note that during the spectrum analyzer operation all clients are disconnected from the access point. Clients will only reconnect when the spectrum analyzer is finished. The analysis time for all radio channels of the two bands is approximately 5 minutes.

✓ The spectrum analyzer operates only on those channels that are specified in the limit-channels parameter in the radio interface settings. For example, if the channels '1 6 11' are specified in the limit-channels on wlan0, and the channels '36 40 44 48' are specified on wlan1, then the spectrum analysis will be performed only for channels 1, 6, 11, 36, 40, 44, 48.
In order to analyze all channels of the range on which the radio interface operates, change the value of the use-limit-channels parameter in the settings of each radio interface to false. After receiving the results of the spectrum analyzer, set the use-limit-channels value back to the original value true.
For more information on configuring the radio interface through the CLI, see the Radio section.
